

# Enrollment Insights

Gain greater control over & visibility into your institution's enrollment planning.

For-profit institutions have changed the landscape in higher education, bringing greater efficiencies for preparing students for successful careers. However, the business model also has its risks. For-profit institutions are driven by enrollment to a much greater degree than traditional universities and colleges. As such, the student enrollment model assumes critical importance in the budgeting and planning process. A faulty enrollment model often has serious financial and strategic consequences. The Enrollment Insight Model service offered by Quantrix provides for-profit institutions with insights previously unattainable with spreadsheet-based modeling.

The Quantrix Enrollment Insight Model delivers:

- Multi-dimensional model that includes transfer assumptions, intake planning, student population, intake growth assumptions, retention rates, credit hour assumptions, student type assumptions, and more.
- Distributed architecture based on the Quantrix Modeling System
- "What if" scenarios that include enrollment drivers changing over time, changes in academic demands, changes in expected assistance, inflation assumptions, and sensitivity of key drivers to outputs
- Interactive dashboards and customized reports
- Full charting capability for trend and exception analysis
- Opportunity for expanding and scaling model
- Bi-directional integration for automated import and export to databases and other applications
- Onsite or online training by Quantrix consultant
- Quantrix software licenses

*"The more I saw of Quantrix, the more I realized that this is what universities need - users can model multiple dimensions of planning, and put them all together in a workable, usable model."*
